NON-FINAL OFFICE ACTION

\* This office action is in response to such Applicants' Amendment of <u>5/10/05</u>.

\* Claims 1, 3-4, 8, 14, 17 and 25-292 are amended. Claims 1 and 3-29 remain pending.

1.2 The prior art rejections of record to the Claims are maintained in response to Applicants'

amendment.

Response to Arguments

2. Applicants' arguments of <u>5/10/05</u> have been fully considered, but are not persuasive

because:

the point where skew is measured or the location of skew adjustment or the means used

in effecting such skew adjustment in the prior art of record is not restricted exclusively to what is

alleged by Applicants;

data signals and clock signals are waveforms, and as such synchronization of such

waveforms entails equivalent steps of measuring skews and adjusting for such skews: See

Bergmann et al. (US Patent No. 4821297), e.g., in 3d sentence of Abstract;

effecting equivalent measurements/skew compensation implemented at different

locations in plural chips rather than a singular chip, while being less cost efficient, does not

depart from the approach of prior art of record.

The Examiner maintains that the prior art of record provides equivalent functionality: the

skew is measured between a signal and a reference at a link point followed by appropriate timing

compensation into the circuit at bar to effect desired signal synchronization at a desired link

point.

Claim Rejections - 35 USC ' 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the

basis for the rejections under this section made in this Office action:

Application/Control Number: 09/752,651 Page 2 of 8

Art Unit: 2133

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 3.1 Claims 1, 3-29 are rejected under 35 U.S.C. 102 (e) as being anticipated by Widmer (US Patent No. 6,496,540; Filed: July 22, 1998).

Widmer discloses skew adjustment algorithm in "Transformation of parallel interface into coded format with preservation of baud-rate" wherein "the step of adjusting transmission delay by a dynamically adjustable delay in each transmission link may be included. The step of retiming coded data blocks on each link with a dedicated adjustable clock, and the step of eliminating skew among the links by providing a second retiming of data transferred on the links at a rate less than the predetermined baud rate with a clock system shared by all links may be included. The steps of receiving transmitted coded data blocks from the transmission lines at a receiver end is preferably included. The step of checking disparity to determine errors in the data blocks at the receiver end may be included. The step of encoding may further include the steps of outputting data blocks from each encoder to a disparity register and inputting disparity data from each disparity register to the encoder associated the disparity register to create a running disparity check of the data blocks. Further steps may include such as deserializing the serially transmitted coded data blocks at a receiver end to provide parallel coded data blocks, decoding the data blocks at a descrialized rate, the descrialized rate being lower than the predetermined baud rate and multiplexing the decoded data blocks to provide parallel data blocks at the Application/Control Number: 09/752,651

Art Unit: 2133

predetermined baud rate. Each uncoded data block may include 10 bits and the predetermined baud rate may be greater than or equal to about 2 Gbaud."

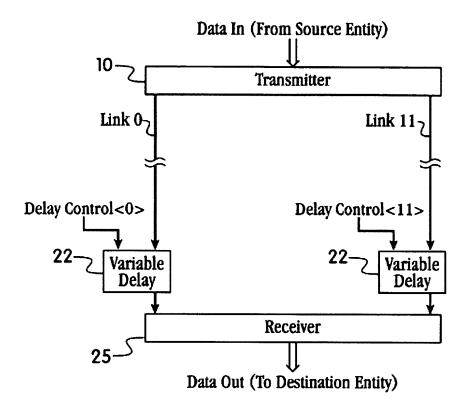

Fig. 6

As per Claims 1, 3-29, Widmer depicts, e.g., in Fig. 6 and related description in col. 1 line 13 et seq., the claimed method, comprising: a) measuring a skew between a data signal and a clock signal at a receiving end of a serial link; and b) adjusting (col. 2 line 27) a phase relationship between said data signal (col. 2 line 30) and said clock signal (col. 2 line 29) to reduce said skew via variable delay means implementable in hardware or software, e.g., in CPU or other digital component: Refer, e.g., to Fig. 6: block 22 and col. 2 line 23 et seq.

Widmer teaches means wherein said adjusting of said phase relationship occurs at a transmitting end of said serial link in col. 9 line 46; further comprising receiving said measured skew at a skew adjustment unit and determining said phase relationship before said adjusting a phase relationship in col. 2 line 27 and col. 10 line 23; further comprising programming said phase relationship into a semiconductor chip or IC chip in col. 9 line 27 and col. 11 line 15.

Widmer further teaches means wherein said adjusting a phase relationship further comprises imposing a delay on at least one of said signals in col. 2 line 27, e.g., "Referring to FIG. 8, each of twelve deserializers 26 is controlled by clocks (CLK<0:11>) derived from the phase adjusted clock 20 for that particular link. After deserialization to a six-line/link width, data remains stable for intervals of close to 3 ns. Thus, if the skew between any two links remains well within these limits, there is enough margin to reclock all 72 lines of the twelve links at this point with a set of clocks CLKS<0:5> to eliminate the skew. The clocks CLKS<0:5> are 1/6th-rate clocks staggered by 0.5 ns but otherwise of uniform phase and all originating from a shared source clock, e.g. CLKS<0> which is aligned with the serial bit-stream of link#0. This common set of clocks controls all functions thereafter to the point where the data is placed into a storage cell of a buffer 30 through decoders 28 and a multiplexer 29. All functions at the output side of buffer 30 are usually controlled by a clock provided by a destination entity, as indicated in FIG. 8."

Widmer further teaches means to impose delay on one or both signals as seen in Fig. 6. And wherein said adjusting a phase relationship further comprises adjusting a phase offset between a pair of phasors associated with a pair of phase interpolators, a first of said phasors used to derive a second clock signal that times the transmission of said data signal, a second of said phasors used to derive said clock signal in col. 2 line 27 wherein equivalent means are provided for eliminating skews via multiple values of a period to effectively result in phase

interpolation means. Also refer to Fig. 6 wherein variable delay blocks 22 are configured to delay signals on the links by more than 360 degrees.

Widmer further teaches that such skew adjustment approach may be used in data communications such as network interface corresponding to a physical layer or wherein said network interface corresponds to a media access control layer, or other transmission system where signals may require synchronization, e.g. col. 1 line 8.

3.2 Claims 1, 3-29 are rejected under 35 U.S.C. 102(b) as being anticipated by Nelson et al. (US Patent No. 5,467,040; 14 Nov.1995).

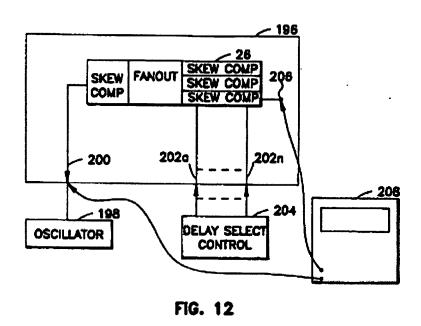

As per Claims 1, 3-29, Nelson et al. anticipates the claimed technique for adjusting clock skew comprising: means for measuring skew between a test/clock signal and a data signal at a destination of a link (Fig. 4 numeral 44), means for determining amount of skew compensation required, and means for injecting (Fig. 4 block 26) such amount of skew compensation into the sending side (Fig. 4 numeral 34) of such link, e.g., in Figs. 4 & 12 and related description at col. 1 line 8 et seq.

Nelson et al. discloses, in Figs. 1-12 and related description, 'an apparatus and method of compensating for skew (time difference) between electrical signals, and a system for generating and distributing skew-compensated signals. More particularly, the present invention relates to a skew compensation circuit capable of providing electronic adjustment in sub-nanosecond increments, methods of adjusting and initializing skew\_compensation circuits, a pulse generator using a skew compensation circuit to precisely adjust the width of the pulse, and a clock distribution system for providing skew compensated clock signals, suitable for use in a high speed computer system.'

Nelson et al. anticipates the claimed invention since disclosed thereby is a method 'for adjusting signal delay on an electronic module having a clock input port, a test point, and a skew compensation circuit, including the steps of injecting a test signal into the clock port of the module; measuring signal delay between the clock port and the test point; comparing the measured signal delay to

Art Unit: 2133

the desired signal delay; calculating the amount of adjustment needed to cause the <u>measured</u> signal delay to equal the desired signal delay; selecting a delay code that reflects the calculated amount of adjustment; and programming the <u>skew compensation</u> circuit according to the selected delay code.'

## Claim Rejections - 35 USC ' 103

- 4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4.0 This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(f) or (g) prior art under 35 U.S.C. 103(a).
- **4.1** Claims 1, 3-29 are rejected under 35 U.S.C. 103(a) as being unpatentable over Widmer (US Patent No. 6,496,540; Filed: July 22, 1998) and Nelson et al. (US Patent No. 5,467,040; 14 Nov.1995).

As per Claims 1, 3-29, Widmer substantially depicts, e.g., in Fig. 6 and related

description in col. 1 line 13 et seq., the claimed method, comprising: a) measuring a skew between a data signal and a clock signal at an end of a serial link; and b) adjusting at end of the serial link (col. 2 line 27) a phase relationship between said data signal (col. 2 line 30) and said clock signal (col. 2 line 29) to reduce said skew via variable delay means implementable in hardware or software, e.g., in CPU or other digital component: Refer, e.g., to Fig. 6: block 22 and col. 2 line 23 et seq.

Not specifically described in detail by Widmer is the step whereby the end of the serial link is the receiving end or the skew compensation is effected at a transmit end or how such skew compensation is caused.

However the point where skew is measured or the location of skew adjustment or the means used in effecting such skew adjustment is not restricted exclusively to a specific point of application by Widmer. Those of ordinary skill in memory testing and skew compensation will recognize that the ability to effect such timing is a circuit design choice.

Accordingly, Nelson et al., in an analogous art, discloses skew compensation wherein skew is detected at the receiving end of end of the serial link, such skew being compensated at the transmit end wherein such skew compensation is caused by adjusting phase of a signal. {See Nelson et al., Id., e.g., Figs. 4 & 12 and col. 5 line 23 et seq.}

Therefore, it would have been obvious to a person having ordinary skill in the art at the time the invention was made to modify the process of Widmer by including therein the sync techniques as disclosed by Nelson et al. because such modification would provide the procedure of Widmer with a method whereby 'the entire clock distribution can be adjusted to compensate for skew in the signals,' or skew compensation can be performed at any convenient point in a link, thereby providing flexibility to the system operator." {See Nelson et al., Id., col. 13 line 14 et seq.}

## Conclusion

\* Any response to this action should be mailed to:

Commissioner of Patents and Trademarks, Washington, D.C. 20231

or faxed to: (703) 872-9306 for all formal communications.

Hand-delivered responses should be brought to Customer Services, 220 20<sup>th</sup> Street S., Crystal Plaza II, Lobby, Room 1B03, Arlington, VA 22202.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Guy J. Lamarre, P.E., whose telephone number is (571) 272-3826. The examiner can normally be reached on Monday to Friday from 9:30 AM to 6:00 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Albert De Cady, can be reached at (571) 272-3819.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the Group receptionist whose telephone number is (571) 272-3609.

Information regarding the status of an application may also be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
